

Quickly access and inspect out-of-reach targets up to 16', 4" with the iShot® Imaging XtendaCam® Tilt – Pole Camera Inspection System, designed specifically for viewing, illuminating and recording inaccessible areas in a matter of minutes. The new slender and lightweight version of the XtendaCam® Tilt System boasts a 1/4" CCD camera and housing on a motorized tilting mechanism allowing the user to change the vertical orientation of the camera in a 320-degree range. The camera system offers a crisp video output, 40:1 zoom, auto-focus, variable shutter, gain, exposure, white balance and backlight compensation. The lighting is provided by an LED white light illumination ring reaching targets up to 25-feet away. The newly designed, user friendly control pad allows the camera head and the lighting to be adjusted quickly and accurately.

This product is now equipped with a standard pole-mounted color recorder with an adjustable 4-inch LCD display, allowing the user to view live video and recorded .mpg video. The recorder is equipped with a 40GB hard drive offering up to 130 hours of video storage space. Footage can also be delivered to external monitors or displays (via the composite output jack) revealing to colleagues an area of interest when the need arises.

The XtendaCam® is equipped with 2 non-slip stabilization legs providing both balance and control when viewing and recording a targeted area. Powered by a rechargeable battery (stored in the base of the splash proof XtendaCam pole handle) the user can perform hours of "cable free" inspections, especially an advantage when in locations where electricity is not available!

The XtendaCam® is ideal for getting quality capture in difficult to reach applications, such as, bridge structure inspections, transportation inspections, viewing inaccessible cavities, over walls, roofs and around corners. The XtendaCam® is perfect for viewing Fatigue Evaluation, Pre-stressed Concrete Structures, Post-tension Concrete Box Girders, Concrete Casts, Multi-girder System, Girder Floor, Beam Stringer System, Steel Box Girders, Rigid Frames, Concrete Spandrel Arches and Columns, Cantilevered Cross Beams, Steel Truss Structures, Concrete Drainage Pipes, Precipitation and debris Wear, Erosion, Decks, Gutters, Inlets, Downspouts, Deck Joints, Inlet Chamber, and Bridge End Collectors.
